Apply Filters to SQL Queries

Project description

The organization is hardening their security, and it is my job to ensure the systems are safe and updated, and to investigate any potential security issues. The following screenshots provide examples of how I used SQL to perform my security tasks.

Retrieve after hours failed login attempts

The company received an alert that there had been several failed login attempts after hours (18:00). In this example I queried the `log_in_attempts` table with the `WHERE login_time > '18:00' AND success = 0;` to find all login attempts that happened after 18:00 that were also unsuccessful.

```
MariaDB [organization]> SELECT *
    -> FROM log_in_attempts
    -> WHERE login_time > '18:00' AND success = 0;
+----------+----------+------------+------------+---------+-----------------+---------+

```

Retrieve login attempts on specific dates

In this example, I needed to find all login attempts that occurred between May 8th and 9th of 2022, so I used the query `WHERE login_date BETWEEN '2022-05-8' AND '2022-05-09';` to output every single login attempt logged between those two dates.

```
MariaDB [organization]> SELECT *
    -> FROM log_in_attempts
    -> WHERE login_date BETWEEN '2022-05-08' AND '2022-05-09';
+----------+----------+------------+------------+---------+-----------------+---------+

```

Retrieve login attempts outside of Mexico

After further investigation, the organization determined that the login issues happened outside of Mexico,so I queried the `log_in_attempts` table with `WHERE NOT country LIKE 'Mex%';` to filter out any results that include possible variations of Mexico such as 'Mex' or 'Mexico' in the `country` records.

```
MariaDB [organization]> SELECT *
    -> FROM log_in_attempts
    -> WHERE NOT country LIKE 'MEX%';
+----------+----------+------------+------------+---------+-----------------+---------+
| event_id | username | login_date | login_time | country | ip_address      | success |

```

Retrieve employees in Marketing

The organization needs to update the computers of the Marketing department employees that are in the East offices. To find this information, I queried the `employees` table with `WHERE department = 'Marketing' AND office LIKE 'East%';` to find all the employees in the correct department and find all the subdivisions of the East office.

```
MariaDB [organization]> SELECT *
    -> FROM employees
    -> WHERE department = 'Marketing' AND office LIKE 'East%';
+-------------+--------------+----------+------------+----------+
| employee_id | device_id    | username | department | office   |

```

Retrieve employees in Finance or Sales

The computers of the Finance and Sales departments also need updating, so to find them I queried the `employees` database with `WHERE department = 'Sales' OR department = 'Finance';` to find every employee logged under either of these two departments.

```
MariaDB [organization]> SELECT *
    -> FROM employees
    -> WHERE department = 'Sales' OR department = 'Finance';
+-------------+--------------+----------+------------+-------------+
| employee_id | device_id    | username | department | office      |

Retrieve all employees not in IT

The team needed to do one last update to everyone that was not part of the IT team, so I queried the `employees` database with `WHERE NOT department = 'Information Technology';` to output all other employees except for the ones in the Information Technology department.

```
MariaDB [organization]> SELECT *
    -> FROM employees
    -> WHERE NOT department = 'Information Technology';
+-------------+--------------+----------+-----------------+-------------+
| employee_id | device_id    | username | department      | office      |

|        1010 | k2421212m542 | jlansky  | Finance         | South-109   |
```

Summary

I used SQL to output specific information to complete several security tasks such as finding unsuccessful login attempts in the logs and finding employees whose computers needed updates. I used different operators to filter through the tables and find the information I needed, such as `AND` to find records that meet two criteria simultaneously, `OR` to find records in a single table that met either of two different criteria, and `LIKE` and `%` to filter through records that may share characters but are not an exact match.
